Thermal coloring alters the physical structure of metal, no matter if it is carbon or stainless steel. In the natural process similar to oxidizing copper, stainless steel may be subject to visual changes on the surface. This shall be considered as a natural maturing of the material. Like the process of inflating metal with air provides unique, unrepeatable shapes, oxidizing paints the surface with individual patterns. Cherish the radical customization!

Gold colored products from The Heat collection can be transparent-lacquered to prevent oxidizing. This is an extra service.
